Isolated nucleic acid having expression vector construct with vascular endothelial growth factor-2 insert, useful for treating chronic limb ischaemia or myocardial ischaemia, autoimmune disorders and allergic

Disclosure; Fig 31; 241pp; English

The invention relates to an isolated nucleic acid comprising pVGI.1 factors construct containing the vasualar endothelial growth factor 2 (VGF-2) insert. The nucleic acid is useful for producing a host cell by transducing, transforming or transfecting a host cell with the DNA and for treating a patient having chronic limb ischaemia or myocardial ischaemia, or a disease or disorder selected from autoimmune disorders (e.g. rheumatoid arthritis, dermatitis), allergic reactions or conditions (e.g. asthma), organ rejection, inflammatory conditions (e.g. conditions, desase), diseases), diseases), diseases (e.g. cardiomyopathy), arthythata, heart valve diseases, aneurymms, arterial occlusive disorders and embolism. This sequence represents the pVGI.1 expression vector containing the VEGF-2

	15565 AAA15565 standard; AAA15565; 28-JUL-2000 (first pMON30464 plasmid. Transgenic plant; ilepidopteran; bipte plasid targeting pe Synthetic. WO200026371-A1. 11-MAY-2000. 04-NOV-1999; 99W(04-NOV-1999; 99W(WPI; 2000-376130/32. X WPI; 2000-376130/32. Y New method of expressing insecticidal proteins in plants transformed with a Bacillus thuringlensis delta-endotoxin encoding gene resulting in effective control of susceptible target pests X Example 1; Page 96-99; 104pp; English. C proteins are toxic to certain insects e.g. Lepidopteran and Coleopteran controlled which larvae. An insect-resistant transgenic plant has been constructed which contains the delta-endotoxin genes into plant cells and for cused to transfer delta-endotoxin genes into plant cells and for subsequent high expression of the cry2Ab gene. Protection may be attained against insects such as ostrina spp., Diatraea spp., Helicoverpa spp., C and spodoptera spp., in Glycine max; and Scirophaga incertulas in Oryza corp. Epinotia spp., in Glycine max; and Scirophaga incertulas in Oryza corp. Epinotia spp., in Glycine max; and Scirophaga incertulas in Oryza corp. Epinotia spp., in Glycine max; and Scirophaga incertulas in Oryza corp. Epinotia spp., in Glycine max; and Scirophaga incertulas in Oryza corp. Epinotia spp., in Glycine max; and Scirophaga incertulas in Oryza corp. Epinotia spp., in Glycine max; and Scirophaga incertulas in Oryza corp. Epinotia comprising an anino-terminal plastid transit peptide (zmSSU PTP) coverinc Comprising to the delta-endotoxin. The fusion protein functions to covaliently linked to the delta-endotoxin the subcellular organelle or compartment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3063
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4322
of alpha-amylase linked to a cellulose binding domain (CBD). The CBD is selected from the Bacillus or cellulomonas endoglucanase, C. xylanase A or the Humicola insolens BdV sequence. The starch is liquefied by treating, in aqueous medium, with such an enzyme hybrid. A recombinant expression vector comprising a construct containing isolated DNA encoding enzyme hybrids with amylolytic activity, promoter and stop signals can be used to transform host cells for the production of the recombinant enzyme hybrids. The enzyme hybrids are useful in industrial starch processing affinity for substrate and increased activity, resulting in at least 1 of reduced calcium ion dependence, reduced formation of Maillard reaction products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4381 CATATGCGGTGTGAAATACCGCACAGATGCGTAAGGAGAAAATACCGCATCAGGCGCTCT

the origin of replication and replication stability sequences, and the promoter and coding sequence for the knammycin/hosomycin phosphotransferase. The plasmid was synthesised form 192 50-mers (see phosphotransferase. The plasmid was synthesised form 192 50-mers (see AAX52021-12) to demonstrate the method of the invention. The specification describes a method for the synthesis of replication competent double-stranded polynucleotides. The method comprises generating a first set of oligomucleotides corresponding to the plus strand and a second set corresponding to the minus strand and ameasing. The method can be used for preparing polynucleotides encoding sequences involved in a biochemical pathway. In particular, they can be used to produce polynucleotides encoding enzymes, e.g. hexofinase, phosphotexose isomerase, phosphotetokides encoding enzymes, e.g. hexofinase, phosphotetokides encoding enzymes, e.g. hexofinase, phosphotetokides enclase or pyruvate kinase, phosphotetoke mutase, enclase or pyruvate kinase. They can artificial genetic systems.

```
The invention provides a novel method for directing self-assembly of a gene having three or more fragments in a directionally and spatially cordered fashion to produce a gene or a gene vector. The method involves usage of primers, containing class IIS restriction endonuclease recognition sites, for isolation of these fragments. As described in the disclosure, the method may also use a vector for the incorporation and screening of endogenous mouse promoter elements for the identification of cell specific promoters. In the example given, plasmids pBx.CMV (AAV33626), pVLMB (AAV33623) and pVLOVDGH-900 (AAV33621) were used as templates from which six fragments were amplified. Each of the fragments contained different requiatory sequences. The six PCR fragments were designed to self-assemble into a retro-vector using the method of the invention. The present sequence, designated as GRNSA 991, represents the monomeric DNA sequence of the six ligated fragments. In general, the method is claimed to be useful for

ALE BIOLOGY CORP.

de capable of rolling circle replication in host, wery of gene function, comprises Rep gene, sequences the polynucleotide and open reading frame encoding est

; 61pp; English.

action describes a polymucleotide that is capable of rolling cation (RCR) in an eukaryotic host. The polymucleotide free encoding from a virus, sequences that are cis on ectide such that he Rep protein can bring about RCR of the de, an open reading frame encoding a protein of interest where the polymucleotide lacks genes of the virus. The ected from the group of genera of family Geminivaridae, and Nanovirus. The polymucleotide sequence is useful for yof the function of genes in eukaryotic hosts, and for enhancing a trait in a host eukaryotic cell, for ing a gene in a plant or in mammalian cell and thus altering inating the function of that gene, as gene sequence delivery manified approaches, for gene therapy applications in whole animal genomics. The present sequence represents of in whole animal genomics. The present sequence represents in whole animal genomics. The present contains the under the transcriptional control of its own promoter, and tive coat protein inactivated by insertion of the bacterial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      351 AAGAACAGTATTTGGTATCTGCGCTCTGCAGTGAAGCCAGTTACCTTCGGAAAAAAGAGTTGG 3620
                                      The invention provides a novel method for directing self-assembly of a gene having three or more fragments in a directionally and spatially ordered fashion to produce a gene vector. The method involves usage of primers, containing class IIS restriction endonuclease recognition sites, for isolation of these fragments. As described in the disclosure, the method may also use a vector for the incorporation and screening of endogenous mouse promoter elements for the incorporation and screening of endogenous mouse promoters. In the example given, plasmid VLSNO2, containing a circularily permuted mouse VL30 genome, was used in the construction of single long terminal repeat (LTR) vectors used in the method of the invention. In general, the method is claimed useful for isolating and identifying regulatory sequences from a cell, including those for enhanced biological activity, or tissue-specific, hormone-specific or developmental-specific gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2125 GCCGCTTACCGGATACCTGTCCGCCTTTCTCCCTTCGGGAAGCGTGGCGCTTTCTCAATG

c production, feed comprises asing hormone into

nich was used to normone releasing the used in the sa a method for lean body mass, lean and milk of an offspring.

of the female animal prior to or during gestation of the offspring under conditions where the nucleotide sequence is expressed. The method is useful of improving or enhancing animal growth, for increasing growth hormone, lean body mass, IGF-I levels, feed efficiency, growth rate, ratio of sometotrophs to other hormone-producing cells in a pituteary gland, and milk production in an offspring, and for delaying birth of an offspring. GHRH nucleic medicine, both human and veterinary, e.g. in treating growth-related discorders such as hypoplutitary dwarfism resulting from abnormalities in growth hormone production, and in stimulating the growth and enhancing feed conversion efficiency of animals raised for meat, milk

The present sequence represents vector pSPG5-12-HV-GHRH, which carries CDNA encoding pig growth hormone releasing hormone (GHRH) cDNA. Nucleic acids encoding GHRH are used in the method of the invention. The specification describes a method for improving or enhancing characteristics e.g. growth, lean body mass, Insulin-like Growth Facts and milk production in an offspring, or and for delaying birth of an offspring. The method comprises introducing a vector, encoding GHRH, into cells of the female animal prior to or during gestation of the offspring under conditions where the mucleotide sequence is expressed. The method is useful of improving or enhancing animal growth, for increasing growth hormone, lean body mass, IGF-I levels, feed efficiency, growth rate, ratio of somatorrophs or enhancing animal growth, for increasing growth hormone, lean body mass, IGF-I levels, feed efficiency, growth rate, ratio of somatorrophs or other hormone-producing cells in a pituitery gland, and milk production in an offspring, and for delaying birth of an offspring growth-related disorders such as hypopituicary dwarfism resulting from abnormalities in growth hormone production, and in stimulating the growth and enhancing feed conversion efficiency of animals raised for meat, milk and egg production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ή:

The method comprises delivering a nucleic acid vector for the expression of a growth factor or neurotrophic factor in a tissue or tissues. The present sequence represents the actual lower sequence of plasmid piGOSS2 nucleotides 1-3599 from the present invention. Due to the growth and stimulatory effects of growth factors and neurotrophic factors, introducing these factors to degenerated muscles in the neural inprove UI by enhancing both their integrity and neural innervation.

This sequence is the actual sequence for pIGO552 which is an example of a vector of the invention. The vector is for expression of a nucleic acid sequence in a cell, and compities: (a) a nucleic acid casecter containing a sequence encoding insulin-like growth factor-1 (IGF-I); (b) a sequence encoding region including a promoter from a sweletal alpha-actin gene; (c) a linker connecting the promoter from a nucleic acid assette, and lacking the coding sequence of a gene with which it is neturally associated; and (d) a 3' flanking region or both, where the arturally associated; and (d) a 3' flanking region or both, where the casestte and comprises a sequence from a growth hormons 3'-UTR. The rector can provide for efficient IGF-I expression, particularly in gene therapy. It can be used for the elivery of IGF-I for treating diseases such as muscle atrophy, diabetes, neuropathy, osteoporosis, and growth disperse, genetic disease such as chacch-mark-tooth disease, AIDS, atherogenesis, atherosclerotic, cardlovascular, cerebrovascular, or peripheral vescular disease, haemophilia, inflammation and side-effects from anti-cancer and anti-viral drugs. The vectors can also be used to research or Ilvestock improvement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2885

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A method has been developed of treating urinary incontinence (UI) in mammals. The method comprises delivering a nucleic acid vector for the expression of a growth factor or neurotrophic factor in a tissue or tissues. The present sequence represents the expected upper sequence of plasmid pigloss nucleotides 1.5800 from the present invention. Due to the growth and stimulacory effects of growth factors and neurotrophic factors, introducing these factors to degenerated muscles in the urinary system can improve UI by enhancing both their integrity and neural innervation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2706 CTAGACGTAATCATGGTCATAGCTGTTTCCTGTGTGAAATTGTTATCCGCTCACAATTCC

This sequence is the expected sequence for pIGO552 which is an example of a vector of the invention. The vector is for expression of a nucleic acid agequence in a cell, and compises: (a) a nucleic acid casette containing a sequence encoding insulin-like growth factor-I (IGF-I); (b) a sequence encoding insulin-like growth factor-I (IGF-I); (b) a sequence encoding insulin-like growth factor-I (IGF-I); (b) a sequence encoding region including one or more sequences necessary for skeletal alpha-actin gene; (c) a linker connecting the 5° flanking region of the nucleic assette, and lacking the coding agouence of a gene with which it is naturally associated; and (d) a 3° flanking region, including a coid casette, and lacking the coding sequence of a gene with which it is naturally associated; and (d) a 3° flanking region, including a 3° flanking region or a 3° non coding region of the nucleic acid cassette and comprises a sequence from a growth hormone 3° UTR. The coefficient (Gr I expression, particularly in gene therapy. It can be used for the delivery of IGF-I for treating diseases such as muscle atrophy, diabetes, neuropathy, osteoporosis, and growth as muscle atrophy, diabetes, neuropathy, osteoporosis, and growth a resulting from diabetes, genetic disease such as Type I or Type 2706 CTAGACGTAATCATGGTCATAGCTGTTTCCTGTGTGAAATTGTTATCCGCTCACAATTCC 2765 2826 ACTCACATTAATTGCGTTGCGCTCACTGCCCGCTTTCCAGTCGGGAAACCTGTCGTGCCA 2885 176 177 ACTCACATTAATTGCGTTGCGCTCACTGCCGCTTTCCAGTCGGGAAACCTGTCGTGCCA 236 237 derecarraareaareaeceaaceeeeeaaaaaeeeeerrieeerarreeeeerriic 296 atherogenesis, atherosclerotic, cardiovascular, cerebrovascular, or peripheral vascular disease, haemophilia, inflammation and side-effects from anti-cancer and anti-viral drugs. The vectors can also be used to create transgenic animals for research or livestock improvement. ```
This invention describes novel expression vector systems containing RNA stability elements from 3. flanking sequences used for establishing expression of a nucleic acid sequence within a tissue. The vectors also facilitate enhanced expression in tissues and target expression with tissue specificity. The expression wectors can be used to treat diseases through gene therapy by targeting the vector to specific tissues. Diseases that can be treated include muscle arrophy associated with neurological, muscular or systemic disease, aging by causing tissues to express trophic factors, haemophilia by causing tissues to express and secrete clotting factor into the circulation, atherogenesis and secrete clotting factor into the circulation, atherogenesis and secrete clotting factor into the circulation, atherogenesis and atherosclerotic cardivoscular, cerebrovascular or peripheral-vascular disease by causing tissues to express factors involved in tissue metabolism. They can be used to replace genes of inherited genetic cells to produce particular proteins or RNA in vitro. To create transpender and particular proteins or RNA in vitro. To create transpender and expensive metabolism the which can be used for research into human diseases, assessing novel therapeutic methods, assessing the effect of chemical and physical carcingens and for studying the effect of chemical and physical carcingens and for studying the effect of chemical and physical carcingens and for studying the effect of chemical and means and proteins controlled expression of the genes they carry and produce a significantly high level of expression. Using 3 UTR sequences reduces the decay rates of the effect of the vectors which decay rates of the decay rates 
                                                                                                                                                                                                                                              Plasmid pIG0335; expression vector; treatment; disease;
